

RRC

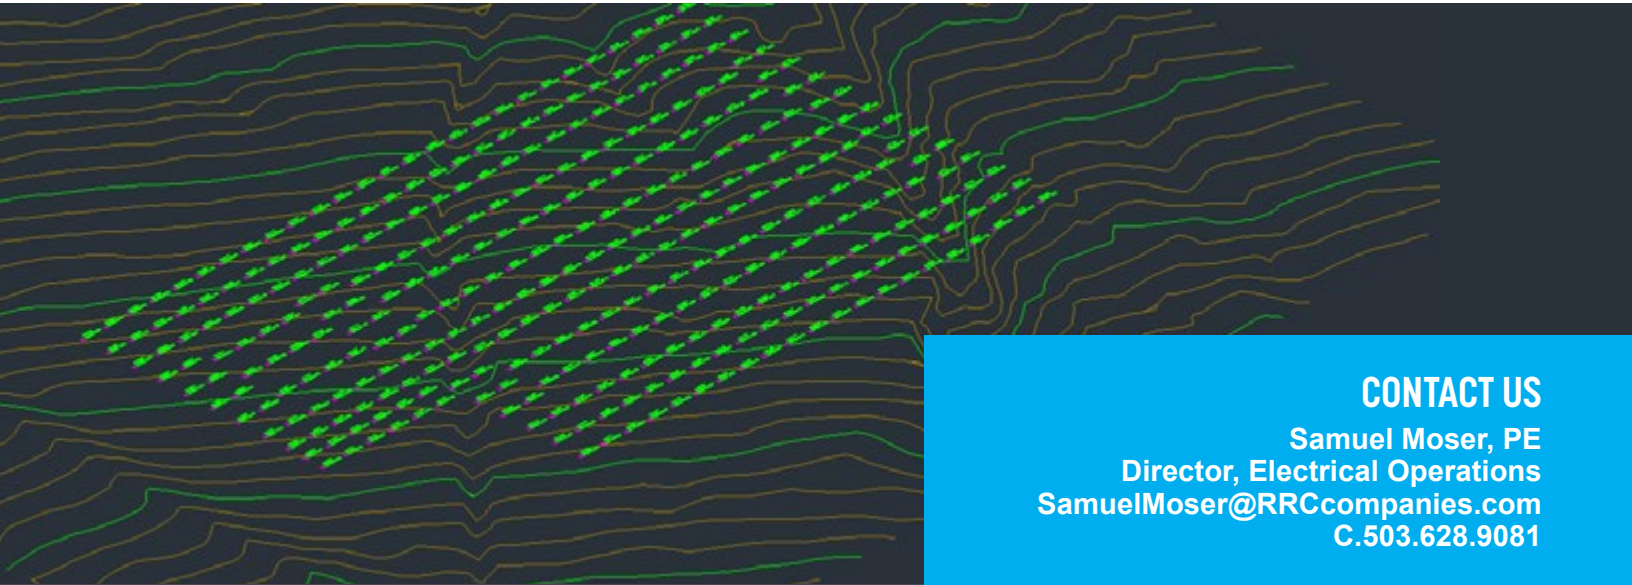

PILE PLOT PLAN

SERVICES

Placing structural piles for solar collector projects of any size requires extreme accuracy. At RRC, we provide that accuracy by combining Survey Grade Geomatics with our experience in structural and civil engineering. This unique combination differentiates our Pile Plot Plan Services from our competitors.

When microscopic construction tolerances are essential, precise engineering calculations are integral to the success of the project.

Our industry knowledge gives clients and construction crews the confidence to undertake this precise process by combining Geographic Information Systems (GIS) and 3D topographic projections to place piles within minuscule tolerances. Using extremely accurate (1:10,000) State Plane Coordinates over precise topographic data gives us a repeatable process that produces accurate results throughout the site. In addition, we pinpoint pile elevations to expedite procurement, and reduce grading for overall **efficiency** and **cost savings**.
